

Web UI Mock Ups for Capstone Project by Elias Christmas 4/15/26

Below are my mock ups for our capstone project application. In them, I use the working title of Hidden Gem Music. I implemented a little gem as the 'i' in Hidden, and I reuse that gem in the UI, in locations like the dots on the map for each country in our dataset. We can absolutely get rid of the gem if you both prefer, or use a better gem.

I handmade every single pixel of these on my iPad using the Procreate app and my Apple Pencil. And because of that, they are a tiny bit more flat looking than an actual user interface would be, which is to be expected. I added gradients in most but not all places I think should have gradients, but of course the gradient won't be absolutely exact as it is in these mock ups.

Also, I purposefully left the information areas of the Country Screen and Comparison Screen empty, so I can gather more information from the team on how that data should be displayed (which the graphs Leena shared for dashboard was a huge help, I'd love to include one here too). I'm wholly prepared to create a basic look of it, and I'm currently creating it in VS code. I want to be sure it's clear I'm not just avoiding the work. Since it's a pretty integral part of the app, obviously the default safe option is just a well organized list that is easy to read and looks good, but we do have more/cooler options so I wanted to ask. Also, I'd love for us to make concrete decisions on what we are including in the filters pop up/screen, so I can really visualize that mentally, and design it physically. I'm reusing the same components from the Welcome screen, plus more, for the Filter screen pop up on the web.

That being said, what I've created so far is *significantly* more than enough for me to start getting UI screens built and completed before the relevant deadline of those tasks on the upcoming Sunday. I usually don't do mockups this detailed (but have learned it's a valuable skill and I should be doing all my mockups this detailed), but I wanted to really be sure all of us can visualize what we're building, especially considering Leena mentioned they don't 'see' things in their mind's eye in the same way I do, I thought this would be a good way to pull it out of my brain where Leena can't see it, and into the world in a tangible way for all of us. Also to be honest it's been a fantastic time designing and planning the UI for this project, especially after I tighten them up after feedback. I've learned this is a pretty standard point of development for front end and/or designer roles in the field so it's great to have this experience.

I also want to be *totally* clear that none of this is set in stone, and if anyone wants anything changed because they simply don't like it, or they think the user experience

could be more streamlined and efficient, I'm absolutely open to that and can make changes if need be.

Also, if you both are okay with it, I think switching comparison mode to comparing 2 countries instead of 3 would be a good idea, along with moving the addition of one more country into a reach goal.

There is no mockup for the credits screen. I will be reusing the components from the Welcome Screen/Pop Up, to make the Credits be the same size and style of pop up, with different contents of course.

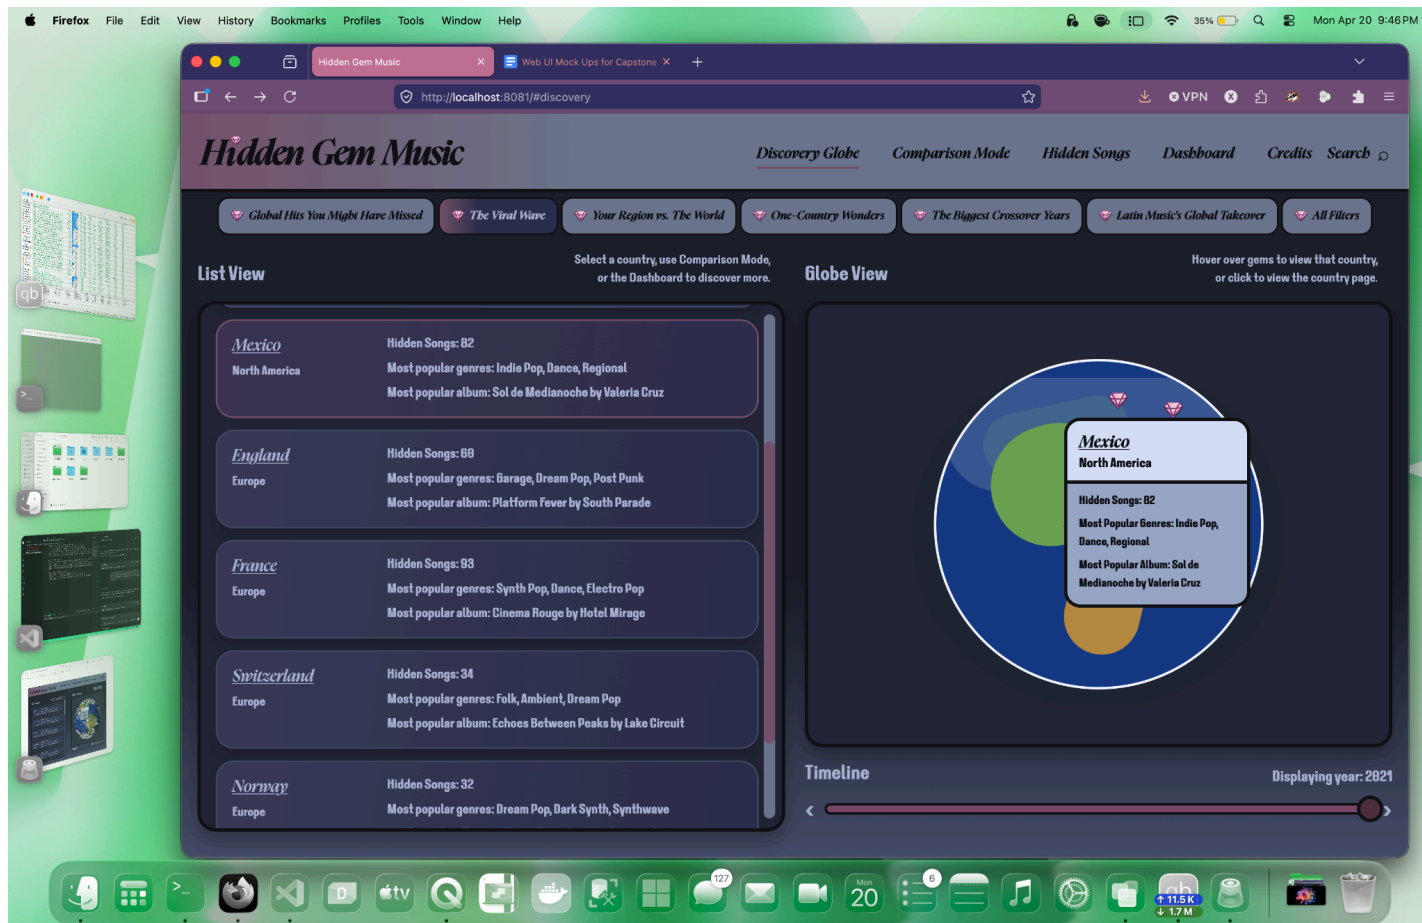

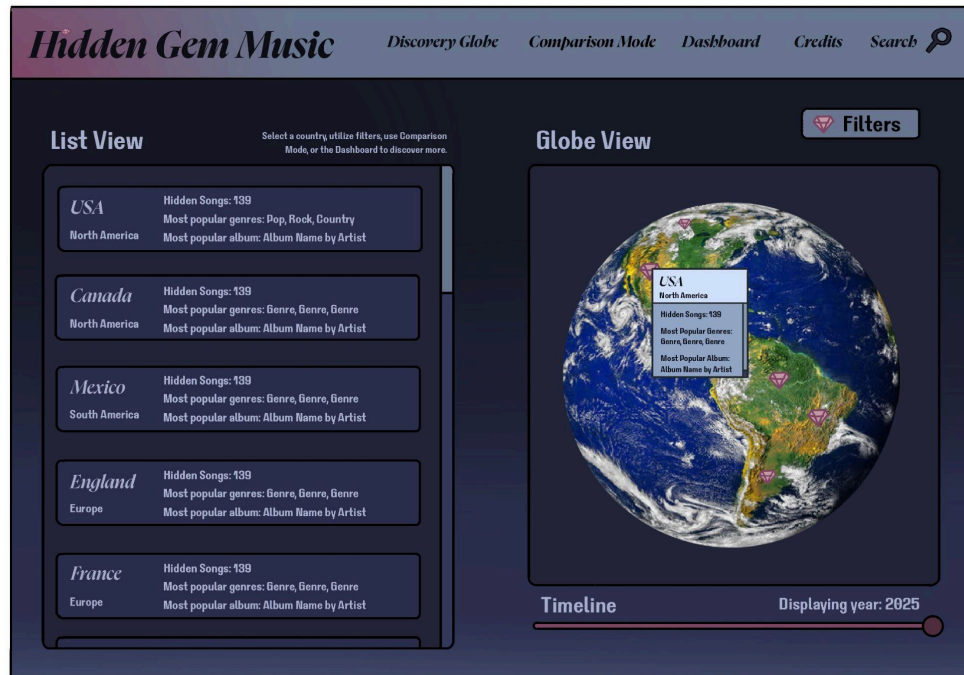

- Notes since I've started building these in VS Code:
 - We need something for users to pick which year they're viewing in the hidden gems screen and the country pages, like a dropdown for example, which triggers a loading pop up when the year is changed to give the app time to reload the data, which is a quick easy addition on my part
 - The way users will navigate to hidden gems pages is via each country page
 - I'm thinking some sort of display showing top 5 hidden songs that year, with the album art in the CD's but not as large as the CD on the hidden gems page, with a button to view all hidden songs for that country that leads to hidden gems page for that country

Mock Ups for Hidden Gem Music:

1. Welcome Screen:

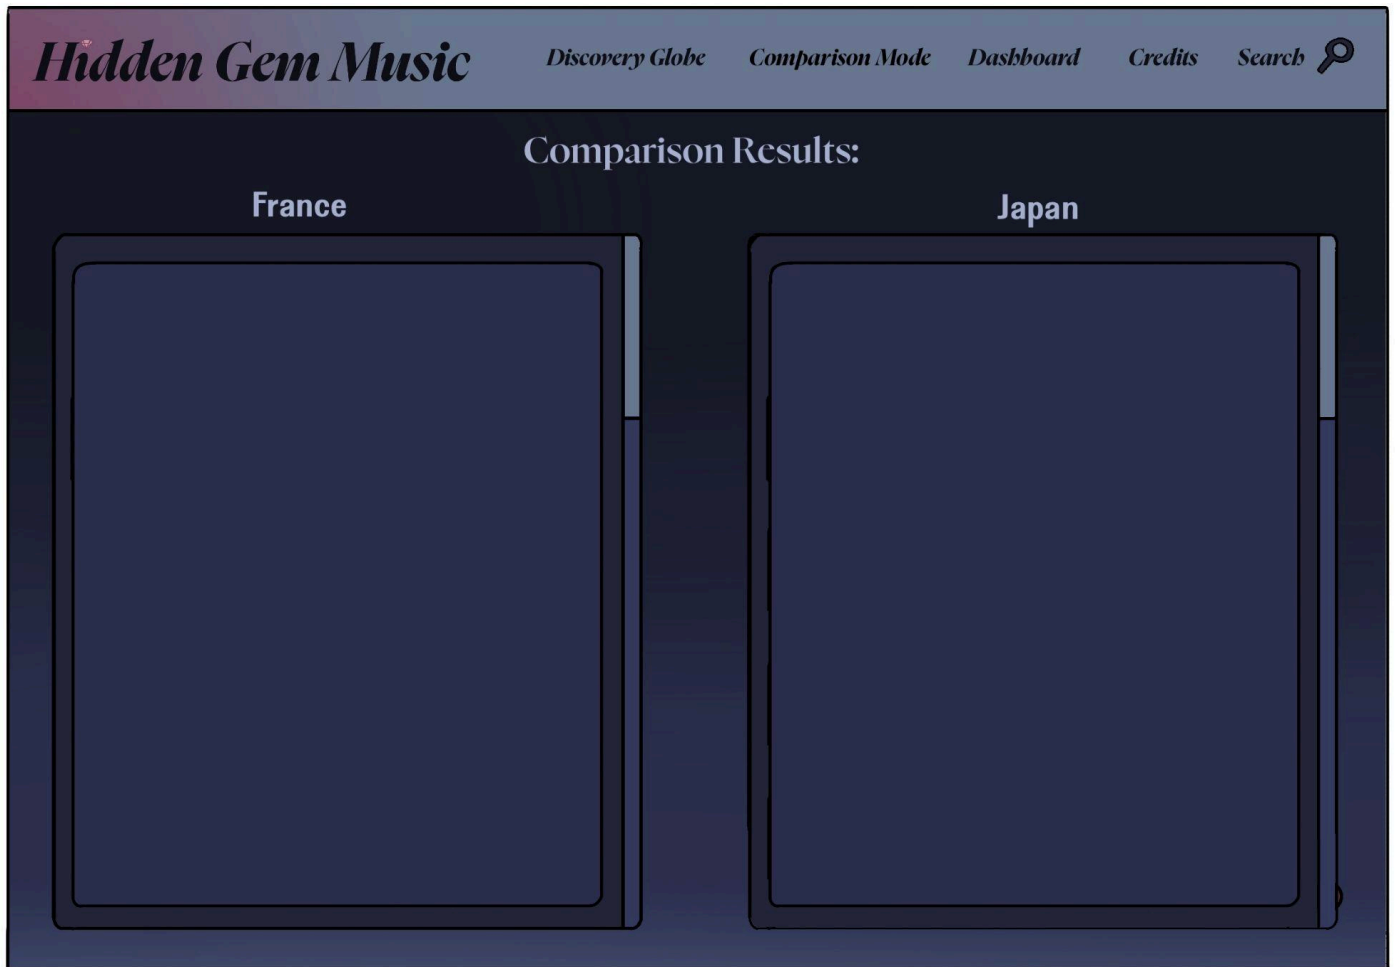

2. Discovery Globe Screen:

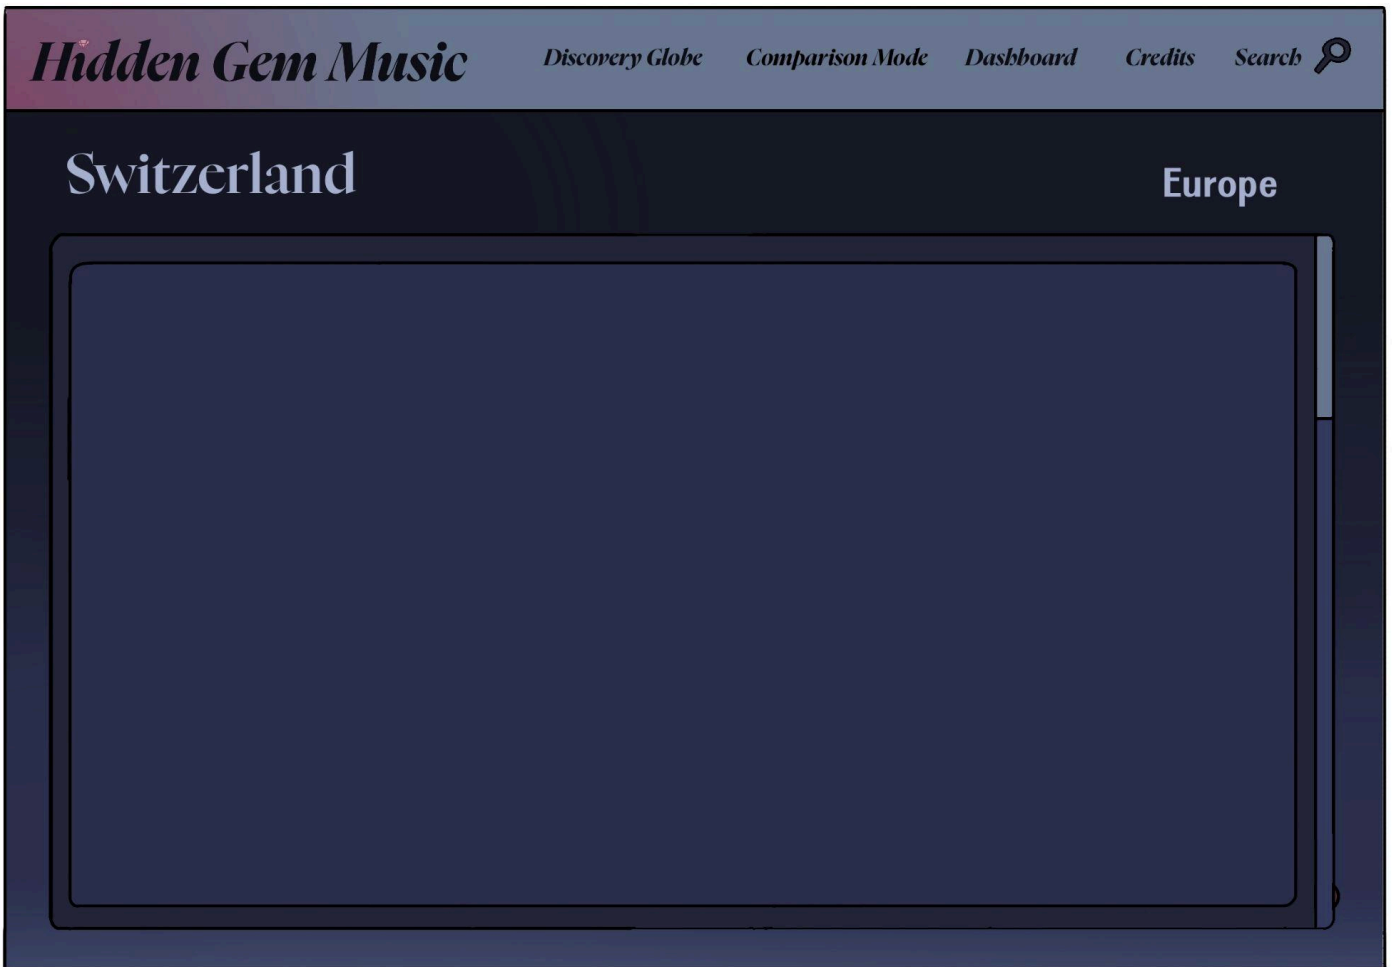

3. Comparison Mode Screen:

4. Comparison View Screen:

5. Country Screen:

6. Hidden Gems Screen

For this screen, I would also be including small album art that appears to be in CD cases, on the right side of each song listed on the list area. Also, I have absolutely no attachment to the style of the play/skip to next buttons (the play button will switch to a pause button when clicked, like standard play/pause buttons) and I will be doing actual official looking buttons in the real UI, they're just tricky for me to draw and these got the point across.

That being said, I love this screen the most. Maybe we should implement CD cases somewhere else somehow, like the most popular album that year in general, on the Discovery Globe page, perhaps?
